70	Fat Mass	1.04 (1.03 - 1.06)	1.07 (1.05 - 1.09)				1.06 (1.03 - 1.08)
	Weight	1.02 (1.01 - 1.02)	1.03 (1.02 - 1.04)				1.02 (1.01 - 1.03)

FOOTNOTE: Hazard Ratios + 95% CIs estimated from Cox proportional hazards models fitted within each of the five birth cohort groups. The resulting estimates were averaged using a random-effects meta-analysis approach to provide an overall estimate of the effect of fat mass and weight on T2D risk in adulthood. Birth cohort groups from 1950-59, 1960-69 and 1970-85 contain some empty cells as individuals within these groups were not yet old enough to provide estimates, without extrapolation, at these adult ages.

eTable 4. Unadjusted Hazard Ratios (95% CI) for the Crude Associations Between Fat Mass and Weight (per-Kilogram Increase) at Age 13 Years and Risk of Type 2 Diabetes (T2D) Between 30 and 70 Years, by Sex, Birth-Cohort Group and Overall

		Birth Cohort Group (N, cases)					
Adult Age (years)	Adiposity marker	1930-39 (28755, 4410)	1940-49 (43548, 5508)	1950-59 (28935, 2299)	1960-69 (19304, 686)	1970-85 (10483, 97)	Pooled
Boys

	Weight	1.22 (1.16 - 1.28)	1.38 (1.30 - 1.46)			

FOOTNOTE: Hazard Ratios + 95% CIs (per SD increase in adiposity marker) estimated from Cox proportional hazards models fitted within each of the five birth-cohort groups, adjusting for childhood height at age 10 years. SDs of adiposity markers at age 10 years were sex- and birth-cohort specific and can be found in Supplementary Table 1. Birth-cohort groups from 1950-59, 1960-69 and 1970-85 contain some empty cells as individuals within these groups were not yet old enough to provide estimates, without extrapolation, at these adult age

eTable 6. Adjusted Hazard Ratios (95% CI) for Associations Between Fat Mass and Weight (per-SD Increase in Exposure) at Age 13 Years and Risk of Type 2 Diabetes Between 30 and 70 Years, by Sex, Birth-Cohort Group and Overall

Adult Age (years)	Adiposity marker	Birth-cohort group (N, cases)				
		1930-39 (28755, 4410)	1940-49 (43548, 5508)	1950-59 (28935, 2299)	1960-69 (19304, 686)	1970-85 (10483, 97)

FOOTNOTE: Survival estimates were censored at 60 years of age. Hazard Ratios + 95% CIs estimated from Cox proportional hazards models fitted within each of the five birth cohort groups, adjusting for childhood height at age 10 years. The resulting estimates were averaged using a random-effects meta-analysis approach to provide an overall estimate of the effect of fat mass and weight on T2D risk in adulthood. Birth cohort groups from 1950-59, 1960-69 and 1970-85 contain some empty cells as individuals within these groups were not yet old enough to provide estimates, without extrapolation, at these adult ages.
